<https://github.com/orazionelson>

DOI [10.5281/zenodo.1443477](https://doi.org/10.5281/zenodo.1443477)

MaRa stands for: **Marcatore dei Registri Angioini**

GitHub repository: <https://github.com/angioXML/MaRa2>

This software is part of a project of [University of Napoli "Federico II"](#), that aims to build an XML archive, a database and a search tool for the **Southern Italian Angevine Chancery Papers**.

A short historical intro

During the World War II, at the end of September 1943, a German army troop retreating from southern Italy burned the *Angevine chancery Archive of Naples Kingdom*. The papers were hosted, for safety reasons, in a village, **San Paolo Belsito**, about 30km far from their building in Naples (then almost daily bombed by the Allies). The German retaliation destroyed thousands of folders containing parchments from the 13th to the 15th century.

After the war, the archivists of **Archivio di Stato di Napoli**, led by Riccardo Filangieri, went in search of the transcripts of the lost acts, administrative and political, which had been made over the centuries by archivists, scholars and historians. Then, they started to rebuild the archive in printed volumes. The reconstruction work continues today, it reached the number of 50 volumes and it covers a range of years from 1265 to 1434, under the main title: **I Registri della Cancelleria Angioina**.

Software Dev for Angevine Chancery Papers in XML

Since 2004, Prof. Roberto Delle Donne, from *University of Napoli "Federico II"*, managed for a digital edition of the **Angevine Chancery sources**, with the aim to realize a research tool accessible through a web interface.

I was involved, as a student of Arts and Literature and worker in IT, at the early stages of the project.

Focusing on available options XML appeared as the most suitable format to store the data, then a DTD was defined by Dott. Manuela Schiano. According to the DTD each XML had to be structured in three parts:

- document metadata
- document content
- editing data

The **content** was structured in: PROTOCOLLO, TESTO and ESCATOCOLLO, that are the three main portions of a medieval document. Inside the document content each part contains children defined with the names of diplomatic: INSCRIPTIO, DATATIO, SANCTIO...

As early transcripts were made by hand from documents, a series of difficulties arose:

- slowness to mark-up the documents,
- different tools used by editors,
- non-separation of concerns.

Moreover, the frustration of editing by hand full sets of documents repeating tags hundreds of times, or the time spent to debug them when transcribed by other editors, brought to a different approach:

let's start from raw .txt files and automate mark-up as much as possible.

Then, this target became the object of my degree thesis in Medieval History: Alfredo Cosco, *Critica documentaria e nuove tecnologie. Problemi, tecniche e un caso di studio*, Università degli Studi di Napoli "Federico II", aa 2007-2008.

MaRa v1 was a set of unordered [PHP](#) scripts with a minimal web interface. It was born to transform text transcripts (made in a standard format easier than XML) in well-formed XML.

MaRa v2 is its evolution and was used to realize a first heavy draft of our XML repository.

All the scripts were rewritten or nested in [CodeIgniter](#), a good option to add features with little effort, extended by an HMVC CMF called [No-CMS](#), really useful and comfortable to build a user interface around the already written functions.

All the functions now are in *models/* and *controllers/* of *mara2/* module.

The new interface integrates a highly customizable text editor like [CodeMirror](#) in order to manage everything inside the browser.

There is a dedicated set of regex written for **CodeMirror** to highlight the text files with different colors: useful to check transcript formal errors; it's possible to see them in the file:

```
registrdev/modules/mara2/assets/scripts/angevin.js
```

The **DTD** has been replaced by an **XSchema**.

And, that's the most important thing, the job is designed in a flow:

from the transcript import to the export in a set of xml valid documents eventually packed in a zip file.

MaRa2 workflow

The starting point is the panel in:

registrdev/mara2/mara2 controller, here you have a TOC based on printed editions designed to manage the flow.

Few notes about the transcript standard

Each *registry* transcript is made by one *.txt* file, it contains different *partitions*, each partition contains from 1 to n *documents*.

Each partition is separated by the tag:

```
#PARTITION#
```

The first line after the tag is the **partition title**.

Then the documents.

Each document must have this structure:

```
[id]. - [title]
[text][primary-sources]
FONTI:[secondary-sources]
```

The pagination follows the printed text, like this example:

```
#PARTITION#
[partition title]
[page number]
[document]
[document]
[document]
[page number]
[document]
[document]
[document]
...
```

So, an end transcript should look like this:

```
#PARTITION#
REGISTRUM IUSTITIARIORUM, LI, IND. II (1273) - Iustitiario Aprutii citra flumen
Piscarie
*RA 11, p. 3
1. - Pro mictenda pecunia ad Cameram.

...

The STEPS

Step1a

This **STEP** splits the entire registry into partitions using the tag **#PARTITION#**.

0) REGISTRUM IUSTITIARIORUM, LI, IND. II (1273) - Iustitiario Aprutii citra flumen Piscarie

1) REGISTRUM IUSTITIARIORUM, LI, IND. II (1273) - Iustitiario Aprutii ultra flumen Piscarie

2) REGISTRUM IUSTITIARIORUM, LI, IND. II (1273) - Iustitiario Terre Laboris et Comitatus Molisii

The highlighted text in the integrated editor helps to find possible transcript errors.

81 FONTI: Chiarito, Repertorium 29, f. 192; Scandone, I comuni di Principato Ultra, in Samnium, XIV, p. 57.

82 17. - ...

83 In simili forma scriptum est Iustitiario Basilicate pro Pandulfo de Fasanella (Reg. 13, f. 229).

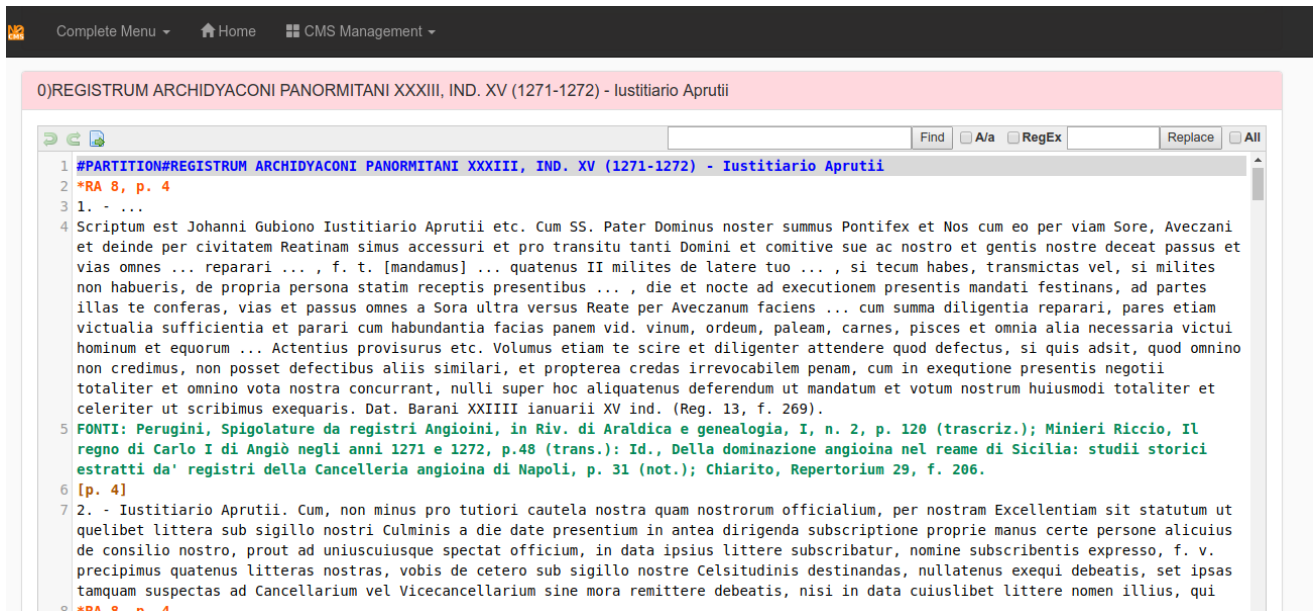

84 FONTI: Chiarito, Repertorium 29, f. 192

85 18. - ...

86 In simili forma scriptum est Iustitiario Calabrie pro Abamundo de Fuscaldo (ibid.).

Step1b

Same as before but it adds page numbers to each document

Step2a

This is the **core** of the application, it inherits most of **MaRa1** functions. The software splits the partitions in single documents and import them in 4 db tables:

- **ra_mara_RXX_index**: and index of all registry partitions with their status:
 - true (for the current editing partitions),
 - false (for the partition to edit),
 - approved (for the released partitions);
- **ra_mara_RXX_document**: for the document data: Title, Text, Pagenumber;
- **ra_mara_RXX_regorig**: for the document primary sources;
- **ra_mara_RXX_source**: for the document secondary sources.

(where XX is the registry id number)

At the top of the page there is an **Info Panel** that works as a first error control:

if the 3 numbers in the panel are the same everything is going well otherwise there's something wrong in the transcript

Each document is analyzed in the tabs at the middle the page.

Genera XML

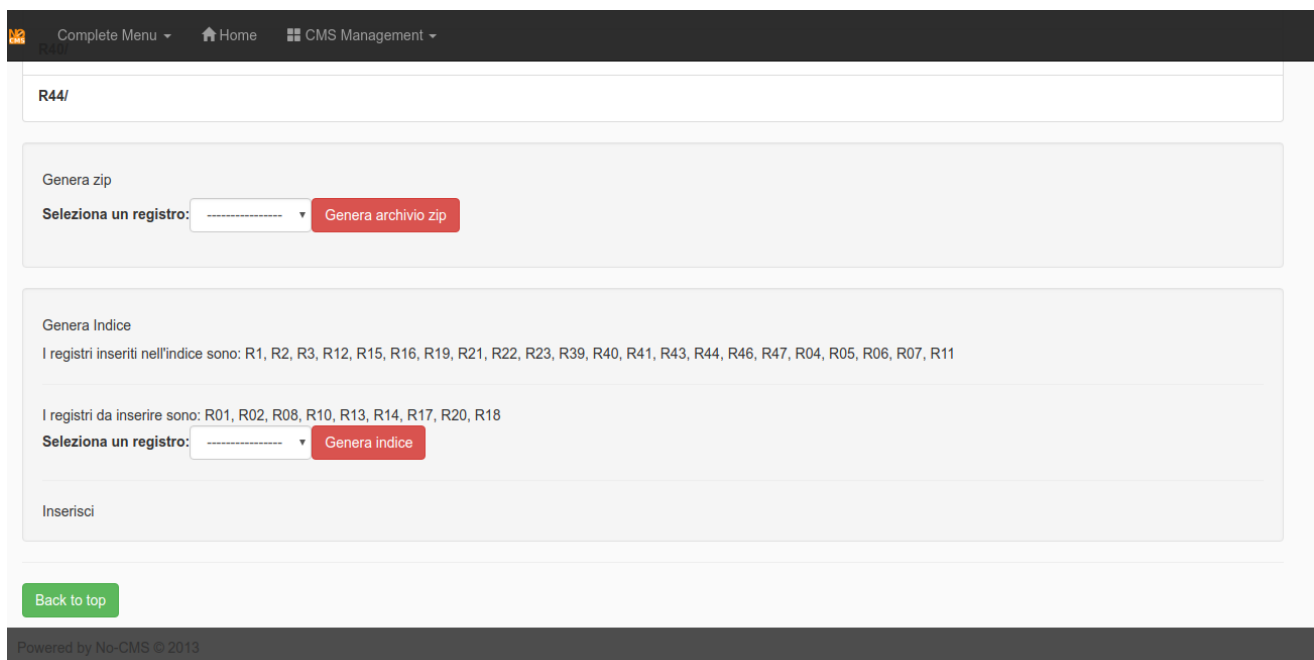

Back to top

Step3b

The last step is dedicated to validating the XML. It is possible to validate the entire transcription or the single document.

Then at the bottom of this interface is possible to pack each generated registry in a zip file or create a TOC of them.

The workflow is strictly connected with the filesystem organization inside the directory:

- *mara_folders/*

the sub-directories:

- *00_originali/* Contains the original transcripts
- *01_trascrizioni/* Contains the transcript at step1
- *02_tocpic/* Contains the images with the TOC of each transcript
- *03_xml/* Contains the generated XML documents
- *04_zip/* Contains the zipped folders with documents
- *05_rollback_files/* Transcript txt files regenerated from the DB during the flow if needed by the editors for further corrections

- *06_toc/* Contains a useful toc of generated documents
- *maradb/* Contains a text-db used for the sources normalization process

At the end of the flow, XML files will be stored in **03_xml/**.

Targets

Almost the half of the entire documents set edited in **I Registri della Cancelleria Angioina** has been transformed to XML using MaRa v1 and v2.

Moreover, the design of the project, bring more consciousness about how to:

design an editing infrastructure based on XML but dedicated to people that have to practice XML as less as possible.

The know-how and the files were transferred in the new project based on [xquery](#) and [eXist-db](#).

Notes about the software installation for testing

MaRa2 is designed for a localhost use, moreover, its specifical features make its use for a different project a *nonsense*, anyway, its installation and use comes as common CMS in a [LAMP](#) environment:

- unzip the package to your apache web-server, so your path will be: <http://localhost/registridev>
- import the **registridev.sql.gz** file in a MySQL table called: *registridev*
- set the CodeIgniter config files, as any CI application, with your server and MySQL data
- set the *registridev/* directory (and everything inside it) permissions to 777
- log-in on **registridev/main/login** as admin/admin
- test the application, go to **registridev/mara2/mara2**

The package in this repository contains a sample registry (R11) ready for the **STEP2A**, you can try to find and correct some errors then transform it in XML files.
